

Smart Meeting Access for Microsoft

Kinly Smart Meeting Access for Microsoft is an interoperability service that enables people using Microsoft® Skype™ for Business, Microsoft Teams, Office 365, Lync® or Surface Hub as well as other traditional videoconferencing solutions – such as Cisco, Polycom, TANDBERG or Life-size – to join the same Skype Meeting.

Teams & Skype for Business in daily work

In many organizations, employees regularly use Microsoft products as part of their daily work. They chat with colleagues, partners and customers, and set up audio and video calls using their desktop or laptop. However, anyone using high-quality videoconferencing or other unified communications platforms cannot join these meetings. This is where Kinly Smart Meeting Access comes into play.

One common interface

Kinly Smart Meeting Access enables traditional video systems to dial into Microsoft meetings with one common management interface.

Your Microsoft meeting is the starting point

Scheduling is done in the usual way, but this time a dialing address for video endpoints will be included in the invite. This way, Kinly Smart Meeting Access provides a bridge between traditional video conferencing, Microsoft Teams and Skype for Business.

Designed for interoperability

Kinly Smart Meeting Access ensures that all your Microsoft videoconferencing platforms communicate seamlessly with other solutions. Whether you're using platforms like Cisco, Polycom or protocols like WebRTC, connection is simple, quick and easy.

Simple and familiar

The native Microsoft user experience is retained, no matter what other meeting participants are using.

Investment protection

Kinly Smart Meeting Access will work with your existing videoconferencing technology, so any investments you have already made in this area are protected.

Supports Microsoft Surface Hub

Kinly Smart Meeting Access also enables your Surface Hub solutions to connect with other videoconferencing solutions.
